Open to full-time roles | Remote worldwide as contractor or via EOR | Open to relocation

PROFESSIONAL SUMMARY

Protocol engineer with 3.5 years building perpetual futures and oracle infrastructure in Rust, TypeScript and Solidity. At Adrena, a Solana perps exchange (~$890M traded during tenure), led protocol engineering across funding, signed price feeds, liquidation keepers and audit remediation. Earlier, ran a zero-knowledge price oracle solo for two years.

PROFESSIONAL EXPERIENCE

Adrena

Lead Protocol Engineer | Dec 2025 - Jul 2026 | Remote

Solana perpetuals DEX; ~$890M traded across 941 traders during tenure. Trading wound down in 2026.

- Led protocol engineering with one direct report in a five-person team; worked directly with both founders, including the CTO, and coordinated delivery with the quant specialist.
- Designed and shipped the Virtual Funding Rate engine: open-interest imbalance drives payments between longs and shorts, with per-market caps and settlement throughout the position lifecycle.
- Built provider-consensus checks and a Rust publisher for signed price feeds (~94,000 batches/day recorded), with RPC failover inside the protocol's seven-second freshness window.
- Authored Rust liquidation, stop-loss/take-profit and limit-order keepers; co-developed Yellowstone gRPC execution with Jito submission and operated the venue's non-voting Solana RPC node.
- Launched five synthetic perpetual markets (gold, silver, WTI, S&P 500, NVDA) across contracts and trading interfaces, with signed market-hours attestations and closed-market trading gates.
- Led Fidesium audit remediation: triaged 33 findings, patched 15, introduced a 48-hour admin-transfer timelock and documented verifiable releases executed through DAO governance.

Autonom

Backend Engineer, Oracle & Market Data (part-time) | Mar 2026 - Jul 2026 | Remote

Oracle and market-data provider for Adrena; part-time alongside the Adrena role.

- Integrated Treasury-bill rates, VIX, Nikkei 225 and US/Hong Kong equities into Rust price feeds, with currency conversion, provider tests and signed per-feed trading windows.
- Built Adrena-compatible signed market-data APIs in Rust/Axum with byte-exact payload validation; diagnosed and fixed a production HTTP/2 connection hang.

Independent Solana Builds

Protocol & Backend Engineer | 2026 - Present | Remote

Three Solana products built with a small team: a non-custodial automation protocol, a vault protocol and NABLA, a live trading terminal.

- Shipped a non-custodial automation protocol on Solana mainnet: Rust/Anchor custody with user-set fee ceilings, per-round spending limits, chain-based settlement and ticket recovery.
- Architected Rust/Anchor vaults with NAV-priced shares, forward-priced settlement and reserved exit liquidity, plus slot-aware execution with on-chain guards against duplicate purchases.
- As NABLA's only engineer, built swap settlement in SOL, USDC or USDT with fees reconciled against finalized mainnet transactions; ran an adversarial security audit and fixed all four high-severity findings the same day.

Doot Foundation

Founder & Sole Engineer | Oct 2023 - Dec 2025 | Remote

Zero-knowledge price oracle on Mina and Zeko devnets.

- Built and operated the oracle solo for two years: 10 assets, 20+ providers, signed aggregation every 10 minutes, o1js recursive proofs, Merkle-committed state and a published client SDK.
- Implemented Pallas-curve Schnorr verification in Solidity for EVM authentication of Mina-signed data; integrated LayerZero lzRead to relay verification state from Arbitrum to Ethereum.
- Built Fizk's (formerly zkUSD) signed price-provider service for a separate Mina stablecoin: Dockerized Node.js, multi-provider feeds, Redis monitoring and DNS-over-HTTPS failover.

Elemental Blockchain

Smart Contract & Full-stack Engineer (contract) | Mar 2023 - Feb 2024 | Remote

- Authored POP! Protocol's Solidity Trading and ERC-721 Positions contracts and trading interface; settled sequencer-signed orders on-chain with ECDSA verification for a testnet perpetuals DEX.
- Led contributions to EBSS on Polygon: built the frontend and The Graph event index, and extended escrow contracts with tokenized invoice claims.

TECHNICAL SKILLS

Contracts & protocols: Perpetual futures, funding rates, liquidations, price oracles, vault accounting, Rust, Anchor, Solidity, SPL tokens, PDAs/CPI, ERC-20, ERC-721, ERC-1155, UUPS upgrades

Backend & product: TypeScript, Node.js, Python, PostgreSQL, Redis, REST/WebSocket APIs, Docker, Next.js, React, The Graph

Security & infrastructure: Smart contract security, LiteSVM, Foundry/Hardhat, fuzz and invariant testing, audit remediation, oracles, keepers, Yellowstone gRPC, Jito, RPC operations, verifiable builds, DAO governance, o1js zero-knowledge proofs

SELECTED PROJECTS

pErp-man. CreditCoin testnet, 2026. Primary contributor: deployed 15 contracts (10 UUPS-upgradeable) for commodity perpetuals, with DAO ownership handoff and a PostgreSQL settlement keeper.

EDUCATION & TRAINING

B.Sc. Physical Sciences with Computer Science

Hansraj College, University of Delhi | 2019 - 2022 | CGPA: 8.9/10

Zero-Knowledge Bootcamp, Encode Club (Q4 2023) · zkIgnite Cohort 2, Mina Foundation (2023): Doot selected for funding
