Open to infrastructure, backend and DevOps roles | Remote worldwide (contractor/EOR) | Open to relocation

PROFESSIONAL SUMMARY

Infrastructure engineer with 3.5 years building and operating backend systems in Rust, TypeScript and Node.js. Hands-on with Linux, Docker, PostgreSQL, Redis, real-time pipelines, deployment automation and production debugging. At Adrena, operated dedicated RPC/gRPC infrastructure and built oracle and execution services. Currently build and operate NABLA's backend; earlier independent work spans mainnet automation and vault infrastructure.

PROFESSIONAL EXPERIENCE

Adrena

Lead Protocol Engineer | Dec 2025 - Jul 2026 | Remote

Hands-on infrastructure and backend ownership at a Solana perpetuals exchange; ~$890M traded during tenure. Trading wound down in 2026.

- Operated a dedicated non-voting Solana RPC node with Agave, Yellowstone gRPC/Geyser, Nginx and TLS; maintained the data infrastructure used by trading and execution services.
- Built a Rust oracle publisher with RPC failover within a seven-second freshness budget; separated price writes from AUM consensus to isolate provider failures. Database sequences indicated ~94,000 signed batches/day over eight weeks.
- Authored Rust liquidation, stop-loss/take-profit and limit-order keepers with concurrent polling, authenticated HTTP triggers and deduplication; co-developed Yellowstone gRPC/Jito execution with backup-stream and direct-RPC fallback.
- Built RPC, gRPC-over-HTTP/2, oracle and Jito health probes with dependency-aware alerts and keeper-wallet checks; automated localnet/devnet integration across programs, ABI, keepers and data services.
- Built funding/revenue APIs and reconciled referral-payout workflows; hardened API authorization and admin audit logging. Shipped the Virtual Funding Rate engine and five synthetic markets with signed market-hours gates.
- Triaged 33 Fidesium audit findings and patched 15; introduced a 48-hour admin-transfer timelock and documented verifiable releases through DAO governance. Worked with founders and the quant specialist; supervised one engineer.

Independent Solana Builds

Infrastructure & Backend Engineer | 2026 - Present | Remote

NABLA backend and operations (current); completed automation and vault builds (2026).

- As NABLA's only engineer, built and run a Node.js/PostgreSQL API on Render serving web and Android clients; implemented bounded provider queues, retry/backoff, WebSocket fanout and persisted transaction reconciliation.
- Built backup/restore tooling and migration rehearsals; verified 69 existing tables remained unchanged in an isolated PostgreSQL schema test using synthetic fixtures.
- Built clean-clone GitHub Actions checks for Android releases with SHA-pinned actions, read-only CI permissions, Gradle checksums and native-dependency hash locks.
- Independently reconciled swap fees in SOL, USDC and USDT against finalized mainnet transactions; fixed four high-severity findings from an internal adversarial review the same day.
- Built Node.js operators and PostgreSQL telemetry for the automation protocol, with chain-based settlement and ticket recovery independent of the database roster; documented runbooks and scheduled accounting/safety checks.
- Shipped Rust/Anchor automation custody with fee and spending limits; built vault infrastructure with NAV-priced shares, forward settlement, reserved exits and slot-aware guards. Maintained automation ABI/SDK compatibility through a mainnet upgrade.

Autonom

Backend Engineer, Oracle & Market Data (part-time) | Mar 2026 - Jul 2026 | Remote

Adrena's oracle and market-data provider; concurrent part-time engagement.

- Built signed market-data APIs in Rust/Axum with byte-exact payload validation; diagnosed and fixed a production HTTP/2 connection hang.
- Integrated Treasury-bill rates, VIX, Nikkei 225 and US/Hong Kong equities with provider tests, currency conversion and signed per-feed trading windows.

Doot Foundation

Founder & Sole Engineer | Oct 2023 - Dec 2025 | Remote

Built and operated a zero-knowledge price oracle on Mina and Zeko devnets for two years.

- Built signed aggregation for 10 assets across 20+ providers on a 10-minute schedule, authenticated APIs, Redis caching, Railway cron pipelines, recursive o1js proofs, Merkle-committed state and a published client SDK.
- Delivered Fizk's signed price-provider service: Dockerized Node.js, multi-provider feeds, Redis monitoring and DNS-over-HTTPS failover. Implemented Solidity Pallas-curve Schnorr verification and LayerZero lzRead relay from Arbitrum to Ethereum.

Elemental Blockchain

Smart Contract & Full-stack Engineer (contract) | Mar 2023 - Feb 2024 | Remote

- Built The Graph event indexing and frontend for EBSS on Polygon; extended escrow with tokenized invoice claims. Authored POP! Protocol's Solidity trading/positions contracts and interface with ECDSA-verified sequencer orders on testnet.

SELECTED PROJECTS

Elekind / Gaj Dastak - Edge AI & Cloud Infrastructure. Built device software and trained detection models for a Raspberry Pi/Coral Edge TPU wildlife-alert system deployed with the Chhattisgarh Forest Department. Worked within a 64K-byte SIM payload limit and built a fixed-IP AWS Lightsail HTTP relay to a Railway/Node.js backend, with AWS RDS metadata and S3 images; migrated RDS to Supabase/PostgreSQL to reduce costs.

SearchLeads - billing backend (2025). Node.js/Express, Prisma/PostgreSQL, Redis and Stripe; subscription/proration flows, webhook deduplication, timestamp ordering, per-user database locks and an offline signed-webhook test harness.

pErp-man (2026). Primary contributor; PostgreSQL settlement keeper and 15 deployed CreditCoin testnet contracts, including 10 UUPS-upgradeable contracts and DAO ownership handoff.

EDUCATION & TRAINING

B.Sc. Physical Sciences with Computer Science

Hansraj College, University of Delhi | 2019 - 2022 | CGPA: 8.9/10

Zero-Knowledge Bootcamp, Encode Club (Q4 2023) · zkIgnite Cohort 2, Mina Foundation (2023): Doot selected for funding

TECHNICAL SKILLS

Languages & backend: Rust, Tokio, Axum, TypeScript, JavaScript, Node.js, Fastify, Express, Hono, Python, Flask, Bash, SQL, REST APIs, GraphQL, WebSocket, HTTP/2, gRPC, JSON-RPC

Infrastructure & delivery: Linux, systemd, Nginx, TLS, Docker, Docker Compose, Git, GitHub Actions, CI/CD, Render, Railway, Vercel, AWS Lightsail, AWS RDS, AWS S3, cron, health/readiness probes, graceful shutdown, deployment automation, runbooks

Data & reliability: PostgreSQL, Redis, SQLite, Supabase, Upstash, Prisma, Drizzle ORM, database migrations, backup/restore, connection pooling, bounded concurrency, rate limiting, caching, retries/backoff, RPC failover, idempotency, reconciliation, Prometheus, Pino, observability, monitoring, alerting, audit logging

Transaction infrastructure: Solana, Agave, Yellowstone gRPC, Geyser, Jito, RPC node operations, event indexing, transaction submission, keepers, oracle aggregation, signed market data, settlement recovery, versioned transactions, address lookup tables

Security & testing: API authentication, CORS, webhook signatures, Ed25519, ECDSA, Schnorr, integration testing, Playwright, Vitest, node:test, bankrun, LiteSVM, Foundry, Hardhat, fuzz/invariant testing, audit remediation, verifiable builds, dependency pinning

Protocol & product breadth: Rust/Anchor, Solidity, Ethereum, EVM, SPL tokens, PDAs/CPI, ERC-20, ERC-721, ERC-1155, UUPS, The Graph, o1js, LayerZero, Next.js, React, React Native, Expo, Mobile Wallet Adapter, Stripe, Raspberry Pi, Coral Edge TPU, YOLOv8
