Open to full-time roles | Remote worldwide (contractor/EOR) | Open to relocation

PROFESSIONAL SUMMARY

Infrastructure engineer with 3.5 years building and operating Rust and TypeScript services. Work spans Linux operations, backend APIs, real-time data pipelines, deployment automation and production debugging, from Adrena's RPC/gRPC and oracle infrastructure to NABLA's live backend.

PROFESSIONAL EXPERIENCE

Adrena

Lead Protocol Engineer | Dec 2025 - Jul 2026 | Remote

Solana perpetuals exchange; ~$890M traded during tenure. Trading wound down in 2026.

- Operated a dedicated non-voting Solana RPC node using Agave, Yellowstone gRPC/Geyser, Nginx and TLS for trading and execution services.
- Built a Rust oracle publisher with RPC failover inside a seven-second freshness budget; separated price writes from AUM consensus to isolate provider failures. Database sequences indicated ~94,000 signed batches/day over eight weeks.
- Authored Rust liquidation, stop-loss/take-profit and limit-order keepers with concurrent polling, authenticated HTTP triggers and deduplication; co-developed Yellowstone gRPC/Jito execution with backup-stream and direct-RPC fallback.
- Added RPC/gRPC, HTTP/2, oracle, Jito and keeper-wallet health checks with dependency-aware alerts; automated localnet/devnet integration across programs, ABI, keepers and data services.
- Built funding/revenue APIs, reconciled referral payouts and hardened authorization/admin audit logging. Shipped the Virtual Funding Rate engine and five synthetic markets with signed market-hours gates.
- Triaged 33 Fidesium findings and patched 15; added a 48-hour admin-transfer timelock and documented DAO-governed verifiable releases. Worked with founders and the quant specialist; supervised one engineer.

Independent Solana Builds

Infrastructure & Backend Engineer | 2026 - Present | Remote

NABLA (current); completed automation and vault builds (2026).

- Built and operate NABLA's Node.js/PostgreSQL API on Render as its only engineer, serving web and Android with bounded provider queues, retry/backoff, WebSocket fanout and persisted transaction reconciliation.
- Implemented backup/restore tooling and isolated PostgreSQL migration rehearsals; tests with synthetic fixtures verified 69 existing tables remained unchanged.
- Added clean-clone Android CI in GitHub Actions: SHA-pinned actions, read-only permissions, Gradle checksums and native-dependency hash locks.
- Reconciled SOL/USDC/USDT swap fees against finalized mainnet transactions with an independent checker; fixed four high-severity findings from an internal adversarial review the same day.
- Built Node.js operators and PostgreSQL telemetry for automation, with chain-derived settlement and ticket recovery independent of the database roster; documented accounting/safety checks and runbooks.
- Shipped Rust/Anchor automation custody with fee/spending limits and ABI/SDK compatibility through a mainnet upgrade. Built vaults with NAV-priced shares, forward settlement, reserved exits and slot-aware guards.

Autonom

Backend Engineer, Oracle & Market Data (part-time) | Mar 2026 - Jul 2026 | Remote

Adrena's oracle and market-data provider; concurrent part-time engagement.

- Built Rust/Axum signed market-data APIs with byte-exact payload validation; fixed a production HTTP/2 connection hang.
- Integrated Treasury-bill rates, VIX, Nikkei 225 and US/Hong Kong equities, with currency conversion, provider tests and signed per-feed trading windows.

Doot Foundation

Founder & Sole Engineer | Oct 2023 - Dec 2025 | Remote

Zero-knowledge price oracle on Mina and Zeko devnets; operated solo for two years.

- Built 10-minute signed aggregation for 10 assets from 20+ providers, authenticated APIs, Redis caching, Railway cron pipelines, recursive o1js proofs, Merkle-committed state and a published client SDK.
- Delivered Fizk's Dockerized Node.js price service with multi-provider feeds, Redis monitoring and DNS-over-HTTPS failover. Built Solidity Pallas/Schnorr verification and a LayerZero lzRead relay from Arbitrum to Ethereum.

Elemental Blockchain

Smart Contract & Full-stack Engineer (contract) | Mar 2023 - Feb 2024 | Remote

- Built The Graph event indexing and frontend for EBSS on Polygon; extended escrow with tokenized invoice claims. Authored POP! Protocol's Solidity trading/positions contracts and interface with ECDSA-verified sequencer orders on testnet.

SELECTED PROJECTS

Elekind / Gaj Dastak. Built Raspberry Pi/Coral Edge TPU device software and trained detection models for an edge-AI wildlife-alert system deployed with the Chhattisgarh Forest Department. Worked within the SIM module's 64K-byte payload limit and relayed its HTTP-only requests through fixed-IP AWS Lightsail to Railway/Node.js. Stored images in S3 and migrated metadata from RDS to Supabase/PostgreSQL to reduce costs.

SearchLeads - billing backend (2025). Built Stripe billing with Node.js/Express, Prisma/PostgreSQL and Redis: subscriptions/proration, webhook deduplication and timestamp ordering, per-user database locks and an offline signed-webhook harness.

pErp-man (2026). Primary contributor; PostgreSQL settlement keeper and 15 deployed CreditCoin testnet contracts, including 10 UUPS-upgradeable contracts and DAO ownership handoff.

EDUCATION & TRAINING

B.Sc. Physical Sciences with Computer Science

Hansraj College, University of Delhi | 2019 - 2022 | CGPA: 8.9/10

Zero-Knowledge Bootcamp, Encode Club (Q4 2023) · zkIgnite Cohort 2, Mina Foundation (2023): Doot selected for funding

TECHNICAL SKILLS

Backend: Rust, TypeScript, Node.js, Tokio, Axum, Fastify, Express, Python, REST APIs, WebSocket, gRPC

Operations & CI/CD: Linux, Bash, systemd, Nginx, Docker, GitHub Actions, Render, Railway, Vercel, AWS Lightsail, AWS S3

Data: PostgreSQL, Redis, SQLite, Supabase, Prisma

Blockchain & clients: Solana, Agave, Yellowstone gRPC, Jito, Anchor, Solidity, Next.js, React
